

CPE-469 Distributed Systems

Programming Assignment 9

Using Modern Distributed Systems

In this programming assignment, you are tasked to find a modern distributed/big data system (examples include but not limited to Apache Hadoop, Apache Spark, HBase, MongoDB, Apache Cassandra) and use it to do a task of your choice. You can use any programming language suitable with the system of choice.

An example, you can use Apache Spark to analyze this [students' dataset](#) and find the average study time for different anxiety score ranges.

You should prepare a 10-minute presentation that answers these questions:

1. What is the task/application you are implementing?
2. What system you are using, including a summary of how it works?
3. Why is this system suitable for your task/application?
4. How did you use the system to implement this task/application?

The presentation should have a demo of the system running, and sample input and output. Presentations will be held on **Wednesday June 3rd**. One or both members can do the presentation.

You should submit your presentation and application files.
